VII. Certain defects in the international application

The following defects in the form or contents of the international application have been noted: see separate sheet

VIII. Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made: see separate sheet

Re Item III

Non-establishment of opinion with regard to novelty, inventive step and industrial applicability

- In its present drafting, independent claim 1 can be objected as relating to a subject matter on which this International Preliminary Examining Authority is not required, under the implementing regulations, to perform an international preliminary examination for the following reasons (Article 34 (4) (a) and Rule 67 (i) PCT).
- The present application concerns a method of convolving an input data set with a 1.1 second data set, by providing suitable approximations for values of data elements of said input data set and said second data set in order to approximate the convolution of said data sets with a certain level of accuracy and, consequently, reducing the amount of data to be processed in the convolution calculation. According to the present application the input data set and the second data set are segmented in a plurality of groups each comprising a plurality of data elements, thereafter it is determined whether the elements included in each of said plurality of groups can be represented as having the same value for the purpose of the convolution calculations, by verifying whether values describing the distribution of the values of the group data elements are less than predetermined thresholds. If this condition is met, then all the individual data values for that particular group do not need to be read; moreover, if the difference between the products of the maximum values of two corresponding groups, each from the first and second data sets, and the product of the minimum values is less than a predetermined threshold, then both groups can be represented by their average value and a product only needs to be calculate once in the convolution operation for all the data elements in both groups.
- 1.2 Insofar as the present text of independent claim 1 can be understood in the light of the description (see Item VIII below), it appears that the subject matter of claim 1 is directed to a method for calculating an approximation of the convolution of an input data set and a second data set comprising the steps of: dividing the elements of each of said data sets in a plurality of groups of data elements; for each group computing values describing how the values of the data elements belonging to said

group are distributed, wherein said values including minimum value, maximum value and average value; for each group approximating the values of the elements belonging to said group with their average value whether the difference between the maximum value and the minimum value is less than a predetermined threshold value; for each pair combination of said groups, one from each set, computing the products of the maximum values and the product of the minimum values and calculating the convolution of each couple of data elements, each from said pair combination, approximating the value of all the elements of both groups with their respective average values whether the difference between said product of maximum values and said product of minimum values is less than said predetermined threshold value; in case this condition is not valid then calculating the convolution of the data elements of said pair combination by using for the data elements of at least one group of said pair combination their real value.

- 1.3 In the opinion of this Authority, present claim 1 is drafted only in terms of mathematical steps operating on abstract data, wherein said mathematical steps describe the algorithm to compute an approximation of the convolution of two data sets.
- 1.4 Therefore, this International Preliminary Examining Authority considers that the subject matter of present independent claim 1, when considered as a whole, is directed to a mathematical method as such and, consequently, this Authority is not required to give an opinion on the questions mentioned in Article 33.1 PCT (see Article 34 (4) (a) and Rule 67 (i) PCT).
- The same type of objection above raised in paragraph 1 to 1.4 of this Writte Opinion is considered valid also for the subject matter of present dependent claim 2, the reasons therefor being the following.
- 2.1 The mere specification of the input data set as "representing a perceivable subject", a part of further unclarities of this wording (see Item VIII below), does not change the fact that said input data are still abstract entities as such and therefore the method of claim 1 is still to be considered as a mathematical method operating on abstract data.

- 2.2 Therefore, under the provisions of Article 34 (4) (a) and Rule 67 (i) PCT, this Authority is not required to give an opinion on the questions mentioned in Article 33.1 PCT with respect of the subject matter of present dependent claim 2.
- The same type of objection above raised in paragraph 1 to 1.4 of this International Preliminary Examination Report does apply to the subject matter of present dependent claims 4, 5, 7, 8 and 11 to 14.
- 3.1 Therefore, under the provisions of Article 34 (4) (a) and Rule 67 (i) PCT, this Authority is not required to give an opinion on the questions mentioned in Article 33.1 PCT with respect of the subject matter of present dependent claims 4, 5, 7, 8 and 11 to 14.

Re Item V

Reasoned statement under Rule 66.2(a)(ii) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

- When amended along the lines below mentioned (see Item VIII of this International Preliminary Examination Report) and insofar as it can be understood in the light of the description, it appears that, the subject matter of present dependent claim 3 taken into combination with the subject matter of independent claim 1 amended along the lines above (see paragraph 1.5 of this International Preliminary Examination Report) and below mentioned (see Item VIII of this International Preliminary Examination Report) would satisfy the requirements of novelty an inventive step as specified in Article 33 (2) and (3) PCT, the reasons therefor being the following.
- 4.1 According to the description, the convolution methods in the technical domain of signal and image processing as known from the internal prior art have the problem of requiring a big amount of calculations due to the high number of multiplication operations involved in convolution algorithms and to the large set of data involved,

specially in application of image processing.

- 4.2 The method of claim 3 in combination with the subject matter of claim 1 seeks a solution to this problem of the internal prior art by providing suitable approximations for values of data elements of an image signal input data set and of a second data set in order to approximate the convolution of said data sets with a certain level of accuracy and, consequently, reducing the amount of data to be processed in the convolution calculation.
 - The solution to the above mentioned problem of the prior art as proposed by claim 3 in combination with claim 1, when amended along the lines set out in this International Preliminary Examination Report, does not appear to be disclosed or rendered obvious by the available prior art, and therefore it would satisfy the criteria of novelty and inventive step as set out in Article 33 (2) and (3) PCT.
- Insofar the text of present claims 6, 9 and 10 can be understood in the light of the 5 description (see Item VIII below) and when said claims would be amended along the lines below mentioned (see Item VIII below), the same type of reasoning of paragraph 4 to 4.2 of this International Preliminary Examination Report would also apply to the subject matter of dependent claims 6, 9 and 10 when taken into combination with the subject matter of claim 1 and claim 3 amended along the lines set out in this International Preliminary Examination Report.
- 5.1 Thus, when amended along the lines set out in this International Preliminary Examination Report (see Item VIII below) and insofar as it can be understood in the light of the description, it appears that the subject matter of present dependent claims 6, 9 and 10 taken into combination with the subject matter of independent claim 1 and dependent claim 3, also amended along the lines set out in this International Preliminary Examination Report, would satisfy the requirements of novelty an inventive step as specified in Article 33 (2) and (3) PCT, for the same reasons above mentioned i paragraph 4 to 4.2 of this International Preliminary Examination Report.
- 6 With regard to the assessment of the present claims 3, 6, 9 and 10 on the gues-

tion whether they are industrially applicable, the following is stated.

Insofar the text of present claims 3, 6, 9 and 10 can be understood in the light of the description (see Item VIII below) and when said claims would be amended along the lines set out in this International Preliminary Examination Report, it appears that the subject matter of present claims 3, 6, 9 and 10 relates to a method of providing suitable approximations for values of data elements of a physical signal input data set and of a second data set in order to approximate the convolution of said data sets with a certain level of accuracy and, consequently, reducing the amount of data to be processed in the convolution calculation.

Therefore, insofar the text of present claims 3, 6, 9 and 10 can be understood in the light of the description (see Item VIII below) and when said claims would be amended along the lines set out in this International Preliminary Examination Report, it appears that the subject matter of said claims would meet the requirements of industrial applicability as set out in Article 33 (4) PCT.

Re Item VII

Certain defects in the international application

7 The features of present set of claims are not provided with reference signs placed in parentheses (Rule 6.2(b) PCT).

Re Item VIII

Certain observations on the international application

- 8 The application does not meet the requirements of Article 6 PCT, because present independent claim 1 is not clear for the following reasons.
- The wordings "mathematically", "obtaining at least one variance value of those 8.1 elements", "significantly" and "substantially" used in claim 1 are vague and unclear and leave the reader in doubt as to the meaning of the technical features to which they refer, thereby rendering the definition of the subject matter of said claim

INTERNATIONAL PRELIMINARY InterEXAMINATION REPORT - SEPARATE SHEET

unclear (Article 6 PCT).

- 8.1a In order to remedy this anomaly the applicant is suggested to delete the wordings "significantly" and "substantially" and to amend the others two wordings as it follows:
 - i) the wording "mathematically" should be amended as "in the real domain";
 - ii) the wording "at least one variance value ... of those elements" should be amended as "a set of variance values describing the distribution of the values of data elements included in the group".
- 8.2 Moreover, the wording used in paragraph c and d of present claim 1 is also vague and indefinite and as such it creates in the reader a state of uncertainty as to the assessment of the extent of the subject matter claimed, which is against the provisions of Article 6 PCT.
- 8.3 A further reason why the subject matter of present independent claim 1 does not fulfill the requirements of clarity as set out in Article 6 PCT is the following. Taking into account the present description and the content of previous paragraph 1.1 and 1.2 of this International Preliminary Examination Report, it is clear that the following features are essential to the definition of the invention:
 - the definition of the criteria according to which it is determined that the values of the elements of a group can be approximated by their average value;
 - ii) the definition of the criteria according to which it is determined that the convolution of two pair combination of groups can be approximated only using their average values.

Since independent claim 1 does not contain these features it does not meet the requirement following from Article 6 PCT taken in combination with Rule 6.3(b) PCT that any independent claim must contain all the technical features essential to the definition of the invention.

9 The wording of present claim 2 as a whole is vague and indefinite and renders the

EXAMINATION REPORT - SEPARATE SHEET

subject matter claimed unclear, which is against the provisions of Article 6 PCT. Moreover, the wording of claim 2 is so broad and vague that the person skilled in the art would be unable, on the basis of the information given in the application as filed, to extend the particular teaching of the description to the whole of the fields claimed.

Therefore, the wording of present claim 2 should be amended in order to properly limit the extent of the subject matter intended to be protected in accordance with the subject matter as disclosed in the application as a whole.

- 9.1 Finally, the wording "comprises a representation of a perceivable subject" used in claim 2 is vague and does not have a clear technical meaning; therefore, it creates in the reader a state of uncertainty as to the assessment of the extent of the subject matter claimed, which is against the provisions of Article 6 PCT.
- 10 Also dependent claim 3 is unclear and it does not fulfill the requirements of Article 6 PCT, because the wording "the image signal providing said input data set" is vague and indefinite and does not have a clear technical meaning.
- 11 Dependent claim 10 is unclear and as such it does not meet the requirements of Article 6 PCT for the following reasons.
 - The wording "independence on" is vague and indefinite and it does not have a clear technical meaning; inorder to overcome this objection the applicant is suggested to amend this wording as "depending on".
- 12 Dependent claim 11 is unclear and as such it does not meet the requirements of Article 6 PCT for the following reasons.
 - The wording "significantly" used in claim 11 is vague and unclear and leaves the reader in doubt as to the meaning of the technical features to which it refers, thereby rendering the definition of the subject matter of said claim unclear (Article 6 PCT).

- Dependent claim 13 is unclear and as such it does not meet the requirements of Article 6 PCT for the following reasons.
 - The wording "preferably" used in claim 11 is vague and unclear and leaves the reader in doubt as to the meaning of the technical features to which it refers, thereby rendering the definition of the subject matter of said claim unclear (Article 6 PCT).
